

Complete AV System Testing to Ensure Proper System Operation

All the efforts in the world to plan, design, define, prepare, and train users on AV technology really do not matter if your system is not fully tested, debugged, and documented. Control Concepts can test clients' entire AV system and make sure everything is working properly.

Control Concepts' field commissioning services can include:

- Testing the entire AV system point-to-point to verify signal flow and manual operation
- Verifying and making any adjustments to audio and video signal levels to meet specifications
- Inspecting the installation to confirm all connections are properly made
- Configure control system devices, set up addresses, load device firmware, and verify network communication
- Testing control system operation to ensure each button operates properly and the system functions effectively in different modes of operation
- Documenting open items and creating an accurate punch list that can be assigned to the specific parties responsible
- Contribute findings to markup installation drawings so that accurate as-built drawings can be made once the system has been completed

Please contact us at projects@controlconcepts.net to learn more about how our field commissioning services can help address your organization's systems needs and enhance ROI.

“

No system ever works perfectly the first time it is implemented. Testing and troubleshooting are a necessary part of the process to iron out installation issues or debug programming.

”
